## ABSTRACT

In this project we are elaborating concept of disease detection of human body using nail image of human fingers and analyzing data from the image of basic of nail color. In this project, the procedure of disease detection is as follows: The input to the system is a person nail image. The system will process an image of nail and extract feature of nail, which is used for disease diagnosis. Here, first training data is prepared using Machine Learning from nail image of patient of specific disease. A feature extracted from input nail image is compared with training data set. In this project we found that color feature of nail image are correctly matched with training set data. We also expand this system to analysis the particular area to maximum patient will health is weak based on hospital patient data with the help of clustering. It is implemented as desktop application in which user submits the heterogeneous data like text and image of skin and nails images. It retrieves hidden data from stored database and deep learning model and compares the user values with trained data set.

**Keywords:** Machine Learning, Malnutrition, Disease Detection.

## I. INTRODUCTION

The Health and nutritional status of children is one of the benchmarks that can indicates the nutritional condition of the wider community, because the pattern of parenting in many communities more priority to toddler. Malnutrition does not occur suddenly, but begins with insufficient weight gain. Malnutrition is a complex topic that draws the attention of the world and many researchers. Nutrition is vital for the health at all ages. Changes in toddler weight within a certain time are an early indication of child nutritional circumstances. In the six-month period, infants who did not gain weight 2 times, were at risk of malnutrition 12.6 times than those with regular weight gain. Based on this, the weight change information can be the parameter to mapping the potential malnutrition problems. Thus, information of area with potential malnutrition is needed as input for government and public policy makers to prevent malnutrition and make a nutritional intervention.

The desired paper is organized as follows. The problem statement and existing system in Section 2; System motivation is presented in Section 3; literature survey in

Section 4; Proposed model in Section 5; and concludes the paper.

## II. PROBLEM STATEMENT

Malnutrition is one of the largest public health problems in developing countries. India contributes 1/3rd of total malnourished children in the world, with prevalence as high as 29.4%.

The purpose of this study was to assess the association of malnutrition with scholastic performance among 8–12 year children data to analysis the health records. This cross sectional study was done among 8–12 year children, with sample children photos with text input data, taking the prevalence as 50%, precision as 10%.

## III. MOTIVATION AND OBJECTIVE

Motivation:

Thus, our main motivation is to find the solution over an it. Where, our system will show the dashboard representation where we can see all the variation in increasing and decreasing order.

Detection of malnourished people is main task of our system.

The proposed scheme should be efficient and the system will be scalable. Through this research it is highlighted that e-government initiative has been expanded to some extent, there are lack of health related projects.

#### Objectives:

The main objective of this system to detect malnutrition's without doctor as an early stage and treatment is taken.

To minimize the malnutrition's children ratio before different health issues.

To reduce the manual process and automation implemented with accurate result

## IV. LITERATURE SURVEY

[1] Cynthia Hayat, Barends Abian, "The Modeling of Artificial Neural Network of Early Diagnosis for Malnutrition with Backpropagation Method", 2018, this research consisted of 2 phases, which were training phase in which it generated ANN weight by using feed-forward of activation function, and testing phase in which the result of the previous stage was tested to obtain output.

[2] Bambang Lareno, Liliana Swastina, Husnul Maad Junaidi, "IT Application to Mapping The Potential of Malnutrition Problems", 2018, this paper focus to find a model of IT application that can be used for mapping the potential of malnutrition problems and the rate of utilization of posyandu. The result, the cross-platform information model developed is a web-based core system, with a mobile application-based support system.

[3] Anutosh Maitra, Rambhau Eknath Rote, Nataraj Kuntagod, "Managing Child Malnutrition via Digital Enablement: Insights from a Field Trial", 2017, in this paper that malnutrition management requires an integrated digital approach – that not only looks at making data available, but also establishing relationships between various program indicators, overlaying that with socio-economic conditions of the region and family demographics.

[4] Sri Winiarti, Sri Kusumadewi, Izzati Muhimmah, Herman Yuliansyah, "Determining The Nutrition of Patient Based on Food Packaging Product Using Fuzzy C Means Algorithm", 2017, the result of the decision will give 3 clusters on nutritional status is good nutrition, malnutrition and better nutrition. Mobile apps are used as a reminder of the nutritional value or ingredients contained in the packaging of food products while consuming food. The result of system testing for application of FCM algorithm in this mobile application obtained validation of 80%.

## V. PROPOSED SYSTEM

The main application of this system is to government to minimize malnutrition percentage.

Patient module:

Upload malnutrition image in this module by patient to check the diseases. Here patient will get the Patient health is critical or not menace disease without any doctor suggestion.

Admin module:

Here admin train the image dataset based on medical related backend for analysis and comparison of upcoming patient images.

Processing module:

Once get the image from patient then proposed algorithm apply the detection process on that image to find out the malnutrition patient or not.

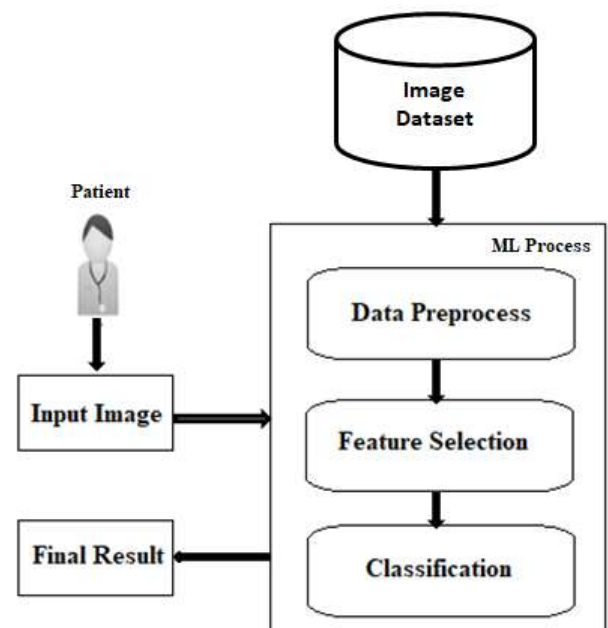

Fig 1. Block diagram

## VI. CONCLUSION

In presented system, system analyzes the human nail and gives probable disease for person including healthy case. Here, for disease prediction nail color (average RGB) value used as a nail feature. This model gives more accurate results than human eye like subjectivity and resolution power. This may give more accurate result for identifying human health condition using machine learning algorithm.

## VII. ACKNOWLEDGEMENT

I wish to express my profound thanks to all who helped us directly or indirectly in making this paper. Finally I wish to thank to all our friends and well-wishers who supported us in completing this paper successfully I am especially grateful to our guide for him time to time, very much needed, valuable guidance. Without the full support and cheerful encouragement of my guide, the paper would not have been completed on time.
